EDUCATION

University of British Columbia Vancouver, BC
Bachelor of Applied Science in Computer Engineering **Expected May 2029**

- Coursework: Data Structures & Algorithms, Operating Systems, Machine Learning, Object-Oriented Programming

EXPERIENCE

Software Engineering Intern **Jun 2026 – Present**
ScalePad *Vancouver, BC*

- Independently designed and built a production-data operations dashboard for **50+ engineers**, replacing manual SRE requests with audited, dry-run-safe SQL workflows and cutting turnaround by **94% (4 hours to 15 minutes)**
- Implemented customizable RBAC across **13 C#/.NET REST endpoints** for a platform serving **12,000+ MSPs**
- Built an employee offboarding API and CSV report, cutting PostgreSQL query latency by **99% (700 ms to 4 ms)** on **39M rows** via pre-aggregation and partitioned indexing
- Deployed fleet-wide resource monitoring (CPU, memory, disk, and latency) for **130,000+ desktop agents** using Prometheus and Grafana, with Terraform-managed alerts for regressions during staged releases

Software Engineer **Jan 2026 – May 2026**
Borrow'd *US, Remote*

- Developed a Django search-analytics pipeline processing **4,000+ weekly searches** to inform homepage recommendations, cutting merchandising analysis time by **67% (15 to 5 hrs/week)**
- Drove engineering delivery for a peer-to-peer item-sharing platform's public pilot serving **600+ users**, coordinating with product and design as an early engineer

PROJECTS

Pear Programming: Collaborative Browser IDE *Java, Spring Boot, TypeScript, PostgreSQL, Redis, Yjs*

- Built a collaborative browser IDE with real-time editing, sandboxed code execution, and persistent team workspaces
- Achieved **40 ms p95** edit latency across **5 concurrent users** using Yjs CRDTs and Redis Pub/Sub
- Engineered a Redis-backed Judge0 queue with retry deduplication and automatic worker recovery after failures

nemu: Desktop App Activity Tracker *Go, TypeScript, React, AWS, Terraform*

- Built a desktop app-usage tracker with a Go agent and a React dashboard that visualizes daily activity patterns
- Designed a Terraform-managed AWS pipeline (API Gateway, Lambda, S3, DynamoDB) for hourly data ingestion
- Prevented lost or duplicate uploads with atomic local storage, idempotent writes, and automatic retries

Sloth: HTTP Performance Diagnostics CLI *Go, Cobra, HTTPTrace, GitHub Actions, GoReleaser*

- Built an HTTP diagnostic CLI analyzing **7 latency phases** with **6 deterministic rules** to pinpoint request bottlenecks
- Engineered a bounded experiment runner executing **600+ requests per suite** across connection-reuse and concurrency tests, with global rate limiting and planned-arrival scheduling
- Implemented a CI regression gate comparing compatible, versioned reports to detect performance regressions

SKILLS

Languages: Python, Java, TypeScript, JavaScript, Go, C/C++, C#, SQL
Frameworks: React, Next.js, Spring Boot, FastAPI, Django, .NET, Node.js
Databases & Cloud: PostgreSQL, MySQL, DynamoDB, Redis, AWS, Terraform, Docker, GitHub Actions
