EDUCATION

University of British Columbia

Bachelor of Applied Science in Computer Engineering

Sep 2024 – Apr 2029

Vancouver, BC

- **Relevant Coursework:** Data Structures & Algorithms, Object-oriented Programming (Java), Applied Machine Learning, Software Construction, Computer Architecture, Operating Systems
- **Honors:** Dean's List (2024W, 2025W)

EXPERIENCE

Atria

Incoming Software Engineering Intern

Jan 2027 – Apr 2027

Vancouver, BC

- Joining the engineering team to develop full-stack features for a Django/React platform, participating in technical design reviews, ERD modeling, and implementation planning

ScalePad

Software Engineering Intern

Jun 2026 – Dec 2026

Vancouver, BC

- Modernized Lifecycle Manager's authorization system for **12,000+ MSPs** by replacing binary admin-viewer permissions with **role-based access control (RBAC)** across C#/.NET services and a React/TypeScript frontend
- Architected a shared comments API that replaced **5+ domain-specific implementations**, standardizing commenting behind a reusable backend model for existing and future product features

Borrow'd

Software Engineering Intern

Jan 2026 – Apr 2026

Vancouver, BC

- Solely built the marketplace's private-group authorization system ahead of beta launch, implementing moderator approval workflows and synchronized Django permission checks for a platform that grew to **250+ users**
- Reduced manual merchandising analysis from **15 to 5 hrs/week** by building a Django search analytics pipeline with optimized PostgreSQL queries, surfacing top user search trends for homepage promotion
- Improved release confidence by integrating automated integration and Playwright tests into GitHub Actions, maintaining **90%+ coverage** across features I owned

PROJECTS

Pear Programming: Collaborative Browser IDE

Java, Spring Boot, TypeScript, PostgreSQL

- Built a collaborative browser IDE with Monaco and Yjs, synchronizing concurrent edits through Redis Pub/Sub and recovering disconnected clients from persisted document snapshots and update logs
- Achieved **~40ms p95** edit latency for **5 concurrent users** by decoupling CRDT updates from presence events
- Prevented duplicate code executions under concurrent retries by building a Redis-backed Judge0 worker pipeline with **atomic idempotency**, renewable worker leases, and bounded retries

Jukebox: AI Reflection Platform

Next.js, TypeScript, Redis, Groq

- Developed an AI reflection platform for **40+ users** to hold personalized conversations with 5 distinct AI personas, with session state persisted client-side
- Prevented long-running LLM inference from blocking Next.js requests by offloading inference to a fault-tolerant Redis Streams worker pipeline with idempotent jobs and automatic worker recovery
- Achieved **~450ms** time-to-first-visible-token by streaming LLM responses over SSE with incremental rendering

Dead Code Explorer: VS Code Extension

TypeScript, VS Code API, ts-morph

- Built a static-analysis extension that flags unreachable files, functions, classes, types, and exports before runtime
- Modeled project-wide file and symbol reachability using compiler-resolved dependency graphs that handle path aliases, barrel re-exports, literal dynamic imports, and dead dependency chains
- Processed **400K+ LOC across 3,000+ files** in **22s p95** via a single-pass compiler index and $O(V + E)$ graph traversal

TECHNICAL SKILLS

Languages: Python, Java, TypeScript, JavaScript, C/C++, C#, HTML/CSS, SQL

Frameworks & Libraries: React, Next.js, Spring Boot, FastAPI, Django, Flask, .NET, Node.js

Databases & Messaging: PostgreSQL, Redis, Apache Kafka

Cloud & DevOps: AWS, Docker, Kubernetes, CI/CD (GitHub Actions, Jenkins)

Developer & Design Tools: Git, GitHub, GitLab, Postman, Figma, Jira
