

Anson Chan

(604) 889-2211 | ac1800@student.ubc.ca | linkedin.com/in/ansonnchan | github.com/ansonnchan | ansonnchan.dev

EDUCATION

University of British Columbia

Bachelor of Applied Science in Computer Engineering

Sep 2024 – Apr 2029

Vancouver, BC

- **Relevant Coursework:** Data Structures & Algorithms, Object-Oriented Programming (Java), Operating Systems, Computer Architecture, Machine Learning, Artificial Intelligence, Relational Databases

WORK EXPERIENCE

ScalePad

Software Engineering Intern

Jun 2026 – Present

Vancouver, BC

- Modernized Lifecycle Manager's authorization system for **12,000+ MSPs** by replacing binary permissions with **role-based access control** (RBAC) across **13** REST endpoints using **C#/.NET** and **React**
- Architected a polymorphic comments API across **6 REST endpoints**, consolidating **5** domain-specific implementations into a single extensible backend model and standardizing future comment functionality across the platform

PROJECTS

nemu: Desktop Telemetry Agent

Go, TypeScript, React, AWS, Terraform

- Built a background telemetry agent in **Go** that logs foreground application activity and produces structured usage summaries
- Designed a serverless ingestion pipeline that automatically uploads activity-session batches hourly through **Amazon API Gateway** and **AWS Lambda**, archives raw events in private **S3** buckets, and stores query-ready records in **DynamoDB**
- Prevented data loss during crashes and network failures through atomic local storage, stable batch IDs, idempotent **Amazon DynamoDB** writes, and automatic retries

Pear Programming: Collaborative Browser IDE

Java, Spring Boot, TypeScript, PostgreSQL

- Built a collaborative browser IDE with **Monaco** and **Yjs**, synchronizing concurrent edits through **Redis Pub/Sub** and recovering disconnected clients from persisted snapshots and update logs
- Achieved **~40ms p95 edit latency** across **5 concurrent users** by decoupling CRDT updates from presence events
- Prevented duplicate code executions under concurrent retries by building a Redis-backed Judge0 worker pipeline with atomic idempotency, renewable worker leases, and bounded retries

VOLUNTEERING

Atria

Incoming Software Engineer

Starting Jan 2027

Vancouver, BC

- Joining the engineering team to develop full-stack features for a Django/React platform, participating in technical design reviews, ERD modeling, and implementation planning

Borrow'd

Software Engineer

Jan 2026 – Apr 2026

Vancouver, BC

- Owned the platform's authorization system end to end, implementing moderator approval workflows and server-side permission checks for **250+ users**
- Reduced merchandising analysis time by **67% (15 to 5 hrs/week)** by building a search-analytics pipeline in **Django** over indexed **PostgreSQL** queries

TECHNICAL SKILLS

Languages: Go, Python, Java, TypeScript, JavaScript, C/C++, C#, HTML/CSS, SQL

Frameworks & Libraries: React, Next.js, Spring Boot, FastAPI, Django, .NET, Node.js

Databases: PostgreSQL, DynamoDB, Redis

Cloud & DevOps: AWS, Terraform, Docker, GitHub Actions
